

daily oof

a personal task tracker for the nurture team
reference and easter egg index

built september 2026 | daily-oof.netlify.app

What this is

Daily Oof is a personal task and project tracker. Everyone signs in with their Arbisoft Google account and sees only their own data. It is not a team board and there is no shared visibility - each person's list is private to them, enforced by Postgres Row Level Security rather than by application code.

The single design goal is capturing a task in under two seconds. Every other decision in the interface is subordinate to that: the input is autofocused, it is never inside a modal, Enter alone saves, and choosing a project is optional because forcing it would break the two-second target.

Stack

Framework	Next.js 15.5 (App Router), TypeScript, React 19
Data + auth	Supabase (Postgres, Google OAuth via PKCE)
Client	@supabase/ssr for cookie-based sessions
Styling	Plain CSS with custom properties. No Tailwind, no CSS-in-JS.
Hosting	Netlify
Analytics	PostHog, installed but parked (no token set)

Why Netlify and not Vercel

Vercel's Hobby plan is restricted to non-commercial personal use, and their fair use policy defines commercial usage to include any deployment produced by a paid employee. This is a work tool built on work time, so Hobby is out of policy from day one - the risk being a takedown after colleagues depend on it, not a bill. Netlify's free plan explicitly permits commercial projects; the only real restriction is that you may not resell their hosting.

Supabase's free tier also permits commercial use. Total running cost is zero, and no payment method is attached to either account, so there is no path to a surprise charge.

Where it lives

Live app	https://daily-oof.netlify.app
Repository	github.com/abduldayan-dan/daily-oof (private)
Supabase project	lvahxlekhhanratmbgcug
Local path	~/Desktop/IS - Design QA/task manager stuff
Design preview	localhost:3000/design-preview (dev only, 404s in prod)

Environment variables

Three, set in `.env.local` locally and under Site configuration in Netlify. The first two are public by design - they ship inside the browser bundle, and RLS is what actually protects data.

NEXT_PUBLIC_SUPABASE_URL	The project URL.
NEXT_PUBLIC_SUPABASE_PUBLISHABLE_KEY	Replaces the legacy anon key, which Supabase retires end of 2026.
ALLOWED_EMAIL_DOMAINS	arbisoft.com - server-side only, never bundled.

Never add the Supabase secret or `service_role` key. It bypasses RLS, and everything here runs somewhere a browser can reach.

How access is actually gated

Three layers, outermost enforced by Google rather than by code:

1. Google consent screen	Set to Internal, so Google refuses any non-arbisoft.com account before the request reaches Supabase or this app.
2. OAuth callback	Checks the email domain and signs out anything that slips through.
3. Middleware	Re-checks on every request, so tightening the allow list takes effect immediately rather than when tokens expire.

Verified directly against the live project: an anonymous caller holding the publishable key can neither read rows nor write them - the write is refused with Postgres error 42501, row-level security violation.

Design system

The visual language is Nurture by Arbisoft, defined in DESIGN.md in the repo. The rules easiest to break by accident:

0px radius	On everything interactive. The checkbox is a square for this reason, not by oversight.
2px strokes	Not 1px, not 3px.
Hard offset shadows	4px 4px 0, and only on hover or press. Never at rest, and never blurred.
Lowercase UI	Nav, labels, buttons and tags. Intentional.
Serif + mono only	DM Serif Display for headings, Roboto Mono for everything else including body. Never add a sans-serif.

Project palette

Twelve pastels. DESIGN.md defines eight; seven are used as-is and five were added in the same family. hot-pink is deliberately excluded - it is not pastel, and DESIGN.md forbids pairing it with brand-orange, which is exactly the active nav background a project dot sits inside.

Deliberate deviations

No automatic dark mode	DESIGN.md does not define one. Inventing a dark palette would take the product off-brand for anyone whose OS is set dark. Inverted mode exists instead, behind the konami code - see egg 1.
Lowercase labels	DESIGN.md contradicts itself: the typography section says labels are uppercase, the tone rules say all UI copy is lowercase. The tone rule wins, being stated more emphatically.
Wordmark, not the leaf mark	The real Nurture mark was never supplied as a file. An approximated logo is worse than none, so the wordmark is set in the brand serif. Drop the asset at public/nurture-mark.svg and uncomment one line in app/brand.tsx.

Motion

Motion is hierarchical on purpose. Completion is the loud moment; everything else is deliberately quieter. If the small things compete, finishing a task stops meaning anything - which was the original brief's argument for animating nothing else at all.

Completion (320ms)	The row winds up left, the checkbox stamps green, a line strikes through the title, then it releases to the right. Three beats, not one fade.
High priority (420ms)	A longer, louder version of the same. The one distinction the list bothers to make should feel different when you finish it.
Deletion (220ms)	Collapses downward, deliberately unlike completion's release to the right, so the two never read as the same event.
Capture (180ms)	The field presses into its own offset shadow and springs back, like a stamp. The new row drops in from above.
Everything else	Ghost tick on checkbox hover, 2px nav lean, priority bar widening, count ticks, save confirmation flashes, one hard shake on error.

All of it collapses to 1ms under prefers-reduced-motion, and the ambient loops - empty-state marks, confetti, idle drift - switch off entirely. Nothing load-bearing depends on an animation finishing.

Easter eggs

Twenty hidden interactions. They share one piece of infrastructure - a takeover queue, a nudge slot, and lib/eggs.ts for the pure logic - so that two full-page moments can never collide and each reaction does not need its own timer.

One rule governs all of them: **an egg must never look like a bug and must never eat input**. Typing "oof" still creates the task. A duplicate warning leaves your text in the field and saves it on the next Enter. Nothing is ever lost to a joke - a colleague who triggers one by accident should never lose work or file a defect.

Grouped by kind rather than by number, so the numbering jumps around. The numbers are stable identifiers - use them to refer to a specific egg without describing it.

Unlocks and secrets

#	egg	trigger	what happens
1	Inverted mode	konami code: up up down down left right left right b a	Flips to navy ground with eggshell strokes and pastel accents, and remembers it. Not invented - DESIGN.md specifies 'Inverted mode: pastel on solid background', so the reward is a dark theme that was already in the spec and unused. Repeat to switch back.
2	oof	type oof and press Enter	The task is still created, then the page shakes once and answers "we've all been there."
4	Palette cycle	click the orange tile 5 times	Each further click moves the brand tile through the twelve project pastels.
7	Lifetime count	triple-click the task count	Swaps the view count for your all-time finished total for a few seconds.

Full-page moments

Four events rare enough to earn the whole screen. Twelve pastel bars sweep up, a line lands in the serif, everything leaves. Click to skip.

#	egg	trigger	what happens
8	Nothing left	clear every open task	Not one view - the entire list. The rarest state in the app, and previously it got exactly the same treatment as clearing three tasks in Today.
9	Good morning	first open of a calendar day	The date in full, held briefly. Makes the app a morning ritual, which is the name.
10	Farewell	sign out	"see you tomorrow." held for a moment before the redirect. It used to jump straight to the login page, which read like a crash.
20	Anniversary	one year after your first task	Lifetime stats, once ever. Derived from the oldest created_at, so it needs no extra data.

Completion reactions

#	egg	trigger	what happens
5	Milestone	every 25th completed task	Page-level confetti and "25 oofs survived". Rewards the long game rather than a single session.
12	Urgent release	complete a high-priority task	A longer, louder animation than a routine one.
13	Combo	3 completions inside a minute	Chains them: "3 in a row."
14	That was quick	complete a task under a minute old	Calls it out.
15	That took a while	complete your oldest open task	Shows the age: "that one took 47 days." Quietly the most satisfying one here.
16	Undo	uncheck a task in Done	Plays the completion in reverse and asks "changed your mind?" rather than the row silently reappearing.

Capture reactions

#	egg	trigger	what happens
3	Impatience	press Enter on an empty field	The placeholder escalates: "nothing?", "still nothing", "take your time", "we can do this all day", "fine. i can wait."
17	Duplicate	re-type a task you already have open	"you already said that." Your text stays put; pressing Enter again saves it anyway.
18	On a roll	capture 5 tasks in 30 seconds	Rewards a brain-dump, which is the behaviour the two-second target was built for.

Ambient and tonal

#	egg	trigger	what happens
6	The shrug	a task 30+ days overdue	"been here a while" in the metadata. A shrug, not a nag - somebody a month past a due date does not need the app raising its voice.
11	Idle drift	5 minutes untouched	Three pastel squares drift slowly across the page. Clears on any keypress. The only thing in the app that moves without being asked.
19	Avalanche	10 or more overdue	Copy shifts from encouraging to gallows humour: "12 overdue. no notes.", and past 25, "it's fine. everything's fine." Encouragement stops landing at a certain point; naming it is kinder than pretending.

Time-aware prompts

Not numbered, but worth knowing: the capture placeholder rotates while the field is empty and knows the hour. Mornings ask "what's the oof?", afternoons "name the dread", evenings "still here?", and after 9pm it simply says "go home".

Known gaps

Documented rather than hidden, in rough priority order.

Unbounded task query	app/page.tsx selects every task ever created on every page load, including completed ones with full notes. At roughly 20 tasks a week that is about 1,000 rows within a year, serialised into the HTML each time. The two-second promise degrades quietly as the payload grows. Highest-value fix on this list.
No error reporting	Failures surface inline to whoever hits them and nowhere else. If a colleague hits a bug they will shrug and stop using it, and you will never find out. This is the one that quietly kills adoption.
No search outside Done	Done has search over titles and notes. The open list does not.
No realtime sync	Two devices drift apart silently; last write wins with no warning.
Inverted mode is hidden	It is a genuinely usable dark theme reachable only by knowing the konami code. Worth considering a real toggle, keeping the code as the fun way in.
PostHog autocapture	Currently parked. Before switching it on, note that autocapture records the text of clicked elements - which here means colleagues' task titles, in a third-party service. Consider autocapture: { mask_all_text: true }.
Data custody	Colleagues' task content lives in a Supabase project on a personal account. Fine for an experiment; worth revisiting if it sticks.

Generated 11 September 2026. Source of truth remains the repository - BRIEF.md for intent, DESIGN.md for the visual system, SETUP.md for provisioning, and lib/eggs.ts for the egg logic.
